Press Release

SARGENT BioFob™ Offers Wireless Biometric Security

New Haven, CT--Biometric security is a fingertip away with SARGENT's new BioFob™, the industry's first handheld, wireless biometric device. BioFob™ uses fingerprint-based biometrics to authenticate the identity of the device's owner before granting access to locks, computers or other proximity card/RF enabled equipment.

BioFob™ integrates easily with existing RF infrastructures, making it simple to overlay biometric verification into existing access control systems. The device is compatible with HID and Indala RFID systems and Bluetooth™ technology. No wiring or separate databases are needed. All fingerprint capture, encoding, processing and verification is done on the BioFob™, and the user's credentials, not their biometrics, are transmitted wirelessly to access points or specified authorities.

Verifying user identity is quick and convenient with BioFob™. After initial enrollment, the user places their finger on the fingerprint sensor. The device then recognizes the fingerprint and wirelessly transmits the appropriate credential. If the BioFob™ is lost or stolen, the device will not recognize the fingerprint of an unauthorized individual and will fail to operate. This biometric recognition brings a greater level of security to all access control systems.

The BioFob™ achieves enhanced security without sacrificing personal privacy. Since all biometric information is stored on the device, there is no need for a centralized biometric database.

The BioFob™ can be ordered pre-programmed with facility and ID codes or, with a Device Configuration Module, each device can be individually programmed for physical access.

The SARGENT BioFob™ was developed by Privaris, Inc., a technology company dedicated to solving security and privacy concerns for government and commercial applications. Privaris solutions directly address a broad range of security needs by performing biometric identity authentication and verification, and corresponding access authorization, without compromising an individual's personal privacy.
